

Pressure Switches

Model:D500/8D

The Sensor of Switch is Diaphragm type, it can be suitable for air, gas such neutral gas and water, hydraulic oil, light fuel, lube and other fluid medium which would not exert corrosion to pressure sensor material. The Set Point of the Switch is adjustable, the adjustable range is from 0.02 MPa to 3Mpa

Switch selection and mounting instructions

The switching points should normally be in about the middle of the adjustable range. Observe switching pressure during normal operation. Do not exceed electrical ratings. Electrical connection by a M18x1.5 cable gland, in accordance with local regulations. For outdoor installation sufficient protection has to be provided for Critical conditions are: Aggressiveness of air, high or low temperatures, drastic changes in temperature, solar radiation, penetration of water. For liquid media with pressure peaks and /or pulsating pressure, install surge damper upstream to eliminate scattering of switching points and excessive wear.

Setting of switching points

Versions with adjustment by screw with hex.
Recessed hole :

Loosen check nut, then set lower switching point.
The upper switching point is determined by the fixed switching pressure difference.

Versions with adjustment by scaled rotary button:
Loosen slot bolt, then set lower switching point.
The upper switching point is determined by the fixed switching pressure difference.

Turning the setting device clockwise shifts switching points upwards.

Use pressure gauge for precise setting (a pressure switch – even if provided with a scale – is not a measuring instrument). Switches can be adjusted even during operation. Depending on the design, setting can be arrested by either check nut or slot bolt.
