

**Pressure Switches (Explosion-proof type)****Model: D505/7D D505/7DK (EX)**

The sensor is Diaphragm-piston type. The switch is suitable for air, steam, Oil mist of gas and hydraulic oil which is non-corrosive, Water-oil emulsion and Neutral liquid medium of Good lubricity. The setting of switch is adjustable, and the range is from 0.3 to 23MPa. The process of using the phenomenon of leakage does not appear.

**Switching Function:****Micro-switch SPDT****Terminals 1-3: Contacts close on rising pressure****Terminals 1-2: Contacts open on rising pressure**

Remark: Even shot pressure peaks must not exceed this value (=max.test pressure)

Dimensional drawing Units: mm

Switch selection and mounting instructions

Setting of the switching points (see pressure switches)

1. Pressure difference is non-adjustable

Choose Cat. No.0816700

Use Range spindle to set the upper or lower switching point on design with fixed switching pressure difference. The opposite one is determined by the fixed switching pressure difference.

On designs with adjustable switching pressure difference . Use Range spindle to set the lower switching point, then use Differential spindle to set the upper switching point by adding the desired switching pressure difference.

Turning the range spindle anticlockwise shifts both switching points upwards. Turning the differential spindle anticlockwise shifts only the upper switching point upwards, i.e. the switching pressure difference (distance between the upper and lower switching points) increases.

Example1:

Desired: Lower switching point 4.4MPa

Upper switching point 5MPa

(Switching pressure difference=0.6Mpa)

Setting: 5MPa (with **Range spindle**)

0.6MPa (with **Differential spindle**)

To set precise switching points a pressure gauge is required.(The pressure switch is a switching and regulating device and not a measuring instrument even if has a scale to assist in the setting.). Switches can be adjusted even during operation. Range- and differential spindle are provided with a releasable detent; switch can also be lead-sealed.

Example2:

Choose Cat. No.0816800

Desired: Lower switching point 8MPa

Upper switching point 8.9MPa

(Switching pressure difference=0.9Mpa)

Setting: 8MPa (with **Range spindle**)

0.9MPa (with **Differential spindle**)

Use Range spindle to set the upper or lower switching point on design with fixed switching pressure difference. The opposite one is determined by the fixed switching pressure difference.

On designs with adjustable switching pressure difference . Use Range spindle to set the lower switching point, then use Differential spindle to set the upper switching point by adding the desired switching pressure difference.

Turning the range spindle anticlockwise shifts both switching points upwards. Turning the differential spindle anticlockwise shifts only the upper switching point upwards, i.e. the switching pressure difference (distance between the upper and lower switching points) increases.

To set precise switching points a pressure gauge is required.(The pressure switch is a switching and regulating device and not a measuring instrument even if has a scale to assist in the setting.). Switches can be adjusted even during operation. Range- and differential spindle are provided with a releasable detent; switch can also be lead-sealed.

2. Pressure difference is adjustable

Example3:

Choose Cat. No.0806700

Desired: Lower switching point 5MPa

Upper switching point 8MPa

(Switching pressure difference=3Mpa)

Setting: 5MPa (with **Range spindle**)

3MPa (with **Differential spindle**)

Use Range spindle to set the upper or lower switching point on design with fixed switching pressure difference. The opposite one is determined by the fixed switching pressure difference.

On designs with adjustable switching pressure difference . Use Range spindle to set the lower switching point, then use Differential spindle to set the upper switching point by adding the desired switching pressure difference.

Turning the range spindle anticlockwise shifts both switching points upwards. Turning the differential spindle anticlockwise shifts only the upper switching point upwards, i.e. the switching pressure difference (distance between the upper and lower switching points) increases.

To set precise switching points a pressure gauge is required.(The pressure switch is a switching and regulating device and not a measuring instrument even if has a scale to assist in the setting.). Switches can be adjusted even during operation. Range- and differential spindle are provided with a releasable detent; switch can also be lead-sealed.
